

Add a Realistic Stone Look to Your Castings in Minutes...

Quarry Tone® Granite FX Fillers are specially blended powders that can be added to some Smooth-Cast® liquid plastics to create realistic stone effects in finished castings. The powders work best with a **fast-curing translucent resin such as Smooth-Cast® 325**. Quarry Tone® powders can also be added to translucent or clear silicone rubbers such as **Dragon Skin® or EcoFlex® Series** for granite-like props that are soft and flexible. Quarry Tone® powders can also be blended to create additional finished effects. There are **10 granite effects powders** to choose from, each with its own particle size and color.

1. Measure & mix Smooth-Cast® 325 and Quarry Tone® powder.

2. After thoroughly combined, pour mixture into mold.
